

All 6 points read correctly. Quick confirmations:

1. **Sender URLs with &pdf=** — yes, use the dev brief. Confirmed.
2. **Catalogues now gated** — correct, marketing handles the asset_type split in GTM via the URL param. No dev work.
3. **mf_modal_open** → **file_download_request** — yes, dataLayer name vs GA4 event name. Use **mf_modal_open**.
4. **Open-redirect guard** — yes please, add it. Good catch. Suggested check:

javascript

```
if (pdf && pdf.indexOf('https://cdn.shopify.com/') === 0) {  
  // proceed with redirect  
} else {  
  // show fallback message, don't redirect  
}
```

5. **sender.track companion events** — skip for now. Add later when we design the nurture flows in Sender.
6. **data-cta on Speak/Get-in-touch anchors** — yes, do it.

Proposed plan — proceed exactly as you laid it out. One note on ordering: build and publish the **/pages/download-thank-you** page **before** I configure the Sender redirects on my side, so the redirects don't 404 during your QA. Your order already does this — just flagging so we sync on it.

One small addition for §1 (the thank-you page template): would be helpful if the page also shows a fallback "Click here to download" link visible from the start (not just if the redirect fails), so users on slow connections or with auto-redirect blocked can still get the file. The script as written has that link in the copy already — just confirm it works without JS too.

Thanks, ship it.
